

1-) Create a .Net Core Worker Service Project listens an Input Folder for data, once file is dropped convert the data format as in sample output data.

Once the conversion is completed new file should be created in the Output Folder and remove the original file in the Input Folder.

Input and Output folder should be defined in applications configuration file.

Application should be able to process multiple files at the same time.

Use the classes definitions as in the UML diagrams below.

Input File Format:

Sequence No Separator = *1*

Customer Name Separator = *2*

Card No Separator = *3*

Expiry Date Separator = *4*

Address1 Separator = *5*

Address2 Separator = *6*

End of Record Separator= *END*

Expected Output File Format:

Sequence No Separator = #SEQNO#

Customer Name Separator = #CUSTNAME#

Card No Separator = #CARDNO#

Expiry Date Separator = #EXPDATE#

Address1 Separator = #ADDRESS1#

Address2 Separator = #ADDRESS2#

End of Record Separator= #ENDRC#
